

### Key RocketSD Benefits:

- Integrated solution simplifying SD-WAN deployments
- Fast, reliable performance for VoIP and business critical applications
- Integrated iStatus® monitoring, and IntelligentAlerts™
- Fully managed solution

## RocketSD™

### Integrated 4G/SD-WAN – Maintaining Connectivity For Business Critical Applications

Businesses today rely on (cloud-based) business critical applications (BCAs) that simply cannot be down. Services such as VoIP (Voice over IP), electronic medical record systems for hospitals, online registration for hotels, online point of sale and credit card transactions, and many more services affect customers and business operations.

As businesses have implemented BCAs, they rely on Internet service providers (ISPs) to provide quality of service to enable their applications to run smoothly. With that said, it is very common for ISPs to encounter congestion, which can cause BCAs to fail or work so poorly that they are unusable.

#### How Businesses Are Overcoming ISP Issues

Businesses have started to adopt software-defined wide area network (SD-WAN) solutions. These solutions hold the promise of allowing a business to implement multiple Internet connections and allow the SD-WAN device to 'steer' traffic over the most appropriate connection, based on the performance needed for critical applications.

#### When Would I Use RocketSD?

If your business uses VoIP or other business critical applications, RocketSD™ will enable you to quickly deploy a solution to improve the performance of your critical applications and also provide 4G LTE based backup Internet connectivity when needed. RocketSD combines an enterprise class SD-WAN firewall, 4G LTE connectivity, iStatus monitoring and alerts, with iStatus FlowTracking™.

RocketSD is a fully managed solution and enables companies to quickly implement SD-WAN based solutions which combine multiple Internet Service Providers and 4G connections. This allows your firewall to steer mission-critical traffic to use the best connection available resulting in improved performance and quality for your business critical applications.

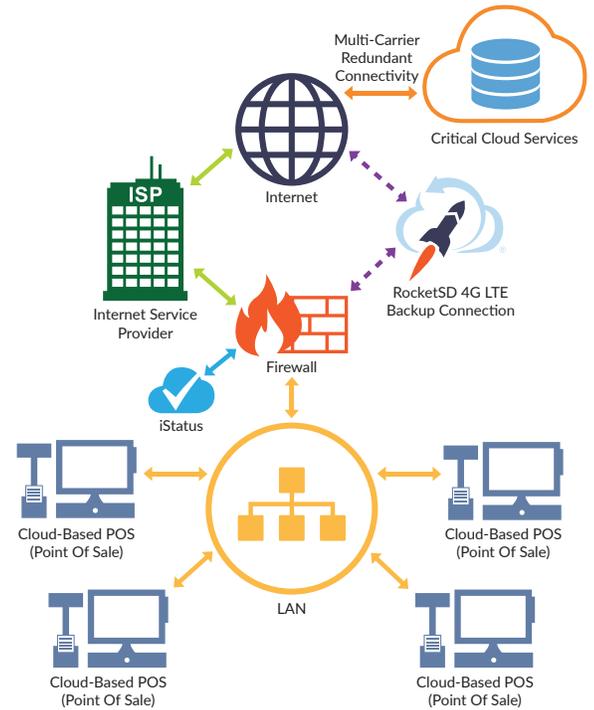

## How RocketSD™ Can Enhance Your Business

For example, say a restaurant is using cloud-based point of sale (POS) system and has a single Internet connection which is shared with many facets of the business. Whenever the Internet is congested (slow), the POS system fails, resulting in unhappy customers.

To solve the problem, the restaurant installs RocketSD, providing a complete SD-WAN solution which can route the critical POS traffic over a 4G LTE based connection whenever the primary Internet experiences congestion.

After RocketSD is installed, the POS system works reliably without any intervention from the IT team or the restaurant staff. Business continuity is maintained, customers are happy, IT is happy, managers are happy, and costs are managed.

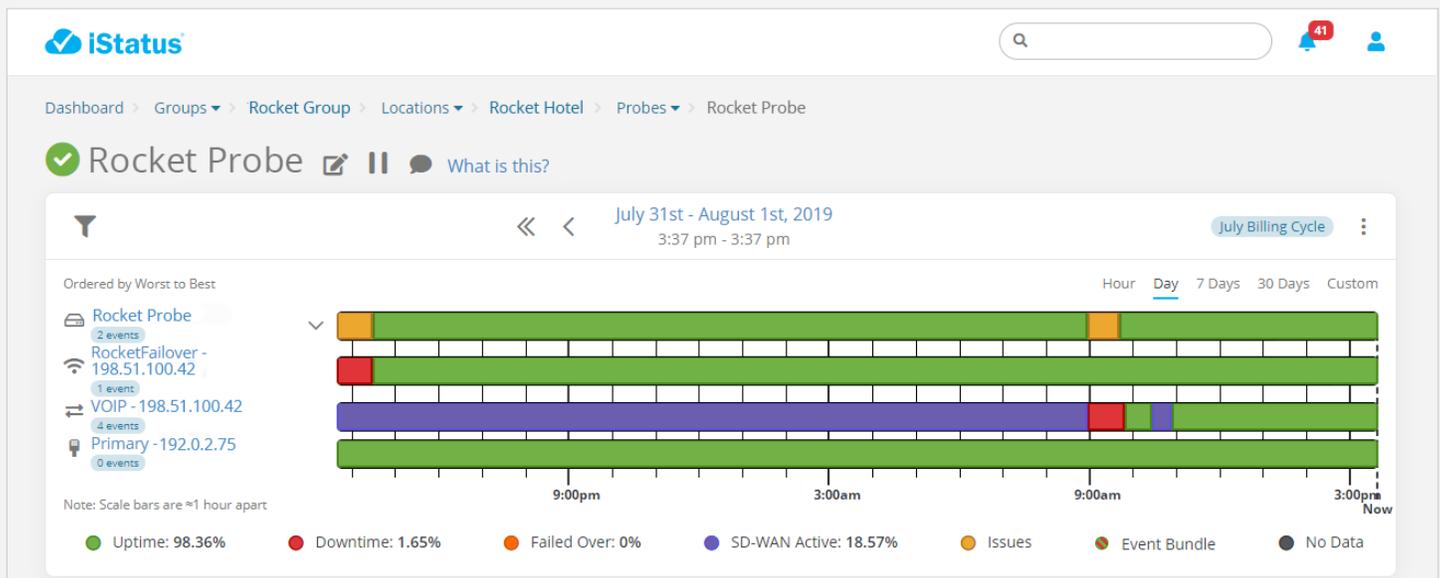

RocketSD also includes iStatus monitoring which provides traffic-flow and downtime alerts to the IT team and key stakeholders to alert them of relevant events.

## iStatus® FlowTracking™ - Traffic Flow Monitoring For SD-WAN Implementations

Major VoIP providers have expressed ongoing challenges when implementing VoIP service for their customers due to unpredictable Internet service. While their technology could be working flawlessly, the ISPs used by their customers frequently have congestion and service-affecting performance that cause VoIP calls to fail.

RocketSD and iStatus FlowTracking were developed to solve these issues. RocketSD is an inexpensive, turn-key solution which solves the problem of poorly performing ISPs by routing VoIP traffic over 4G when primary connections are degraded.

Using iStatus FlowTracking, SD-WAN traffic flows can be observed. This allows you to know how your SD-WAN rules are performing using time-correlated timelines, providing uptime state information for all of your Internet connections as well as the status of RocketFailover.
